Face Gate Centralized Application

Mantra's software solution is independently developed for enabling 24/7 convenient and secured services for the client.

Our Product FaceGate is a standard centralized middleware raw data application with various provisions of maintaining the devices deployed at n number of locations, monitoring the transactions, controlling notifications & Alerts, integrating the same with 3rd party applications, etc. The only thing is it is not a full-fledge attendance system from where one can derive attendance reports. Following are the menu along with its brief description available with the

Face Gate :

Main dashboard : In this module, there is a live dashboard that showcases the total number of individuals present centrally, and present individuals are bifurcated into several employees, labourers, staff, etc. If the hardware is a combination of temperature detection, then high-temperature and users without masks present are also visible on the dashboard. Also, a graphical representation of transactions is available.

Device health monitor : Total number of devices in PAN India synched with this centralized software, will be reflected in this module. This dashboard shows all the information of the devices like its IP address, device id, location of deployment, last synched date, number of registered users, device status (offline and online), and the transaction count.

Alert Dashboard : This dashboard is useful if the biometric hardware can measure the temperature of the user. So, it basically showcases the number of people/individuals with a temperature greater than the threshold value, without masks, or some other incidents that happened on the premises.

Transaction Monitor : People/ Individuals' daily punch-in, punch-out transactions along with location names are reflected in this dashboard.

Master Reports

User Master : The number of users (HR, Admin, manager, employee, etc) of this centralized application can be created from this master module.

Entity Master : Entity is a combination of Employee, Contractor, Staff, Visitors, etc. This module will showcase the list of the entities available in this application.

Entity Kiosk : This module is basically used to add different entities to any location in this application.

Device (Master): The number of devices integrated with the centralized application will be reflected here. Also, we can add/delete different devices that we want to integrate with this centralized FaceGate application.

Location(Master): In the PAN India location, if we want to add one more location then that provision is available under this module.

Transaction

User Upload: If we want to sync/upload any entity with some other device that that provision is available under this module.

Reports

Unregistered user log : This module provides the information of unregistered individuals' login attempts with the particular device at the particular location.

Reject transaction : This module provides the information of transactions that are rejected by the biometric hardware.

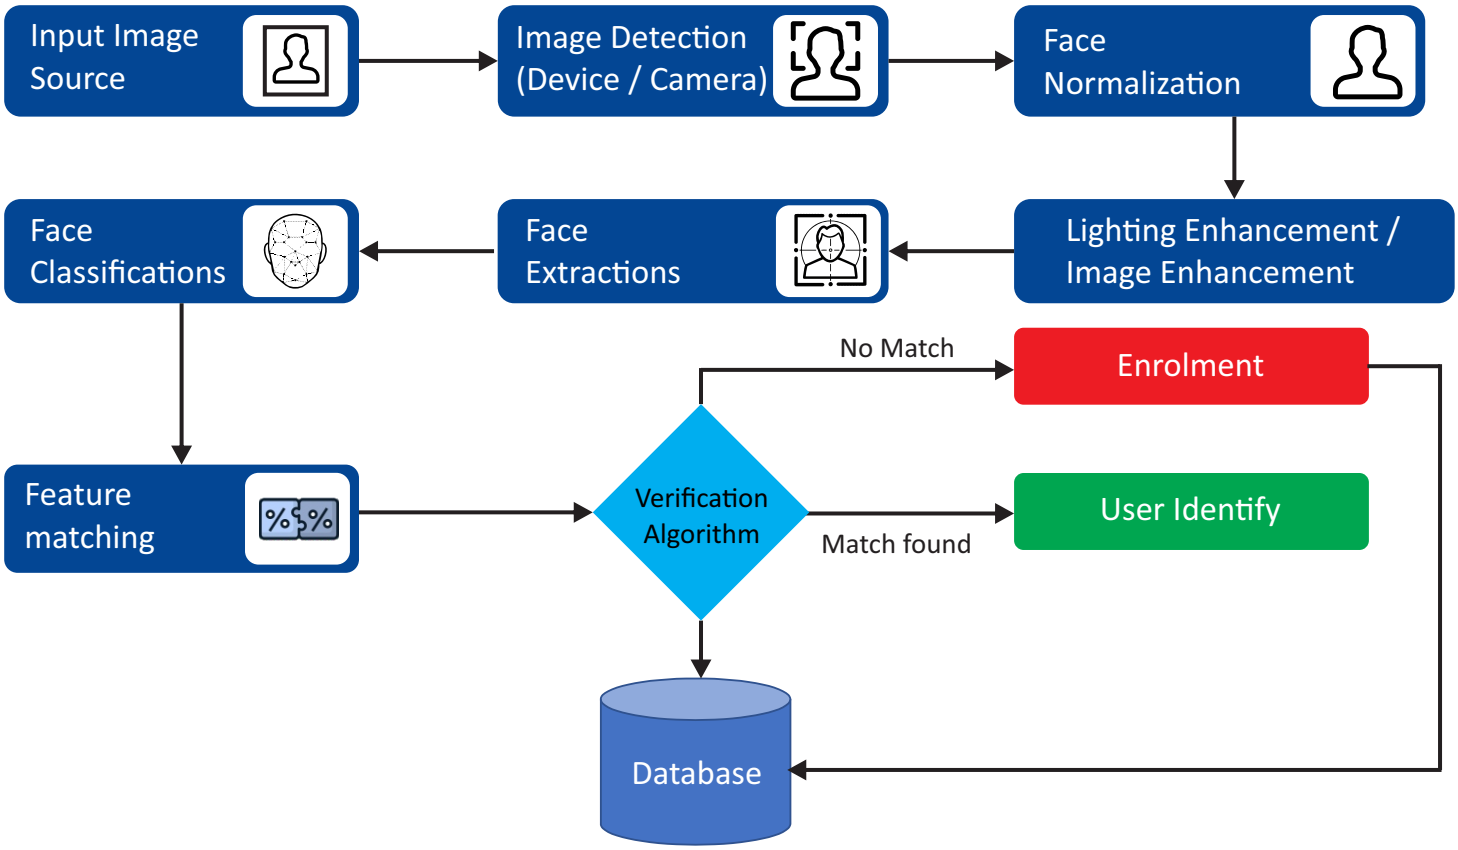

Attendance log : Reports of entities/ individuals detected with high temperature can be generated from this module.

High-temperature detection : Reports of entities/ individuals detected with high temperature can be generated from this module.

Key highlights of The Attendance Management system are as under:

- Highly configurable attendance rule engine
- Quick and efficient attendance processing
- Device health monitoring and alert dashboard
- Attendance raw data capture from hardware, seamless sync
- Secured and real-time integration system
